

```
const map = new Map({  
  container: 'map',  
  style: MapStyle.STREETS.DARK,  
  terrain: true,  
  terrainControl: true  
});
```

Maps Search Engineer – Recruitment Task

Minimal Geocoding API Service

Objective

Develop a minimal API service that behaves like a geocoding endpoint. The endpoint should support both forward geocoding (translating a place name into coordinates) and reverse geocoding (translating coordinates into a place name) using a single endpoint.

Deliverables

- **Code Repository** (GitHub)
- **Documentation:** A README file that covers:
 - Setup instructions.
 - Architectural decisions.
 - Rationale behind the chosen tech stack.
 - Future improvements or scalability strategies.
- **Time demanding:** We think, you should not spend more than 1 day of work with this task, although we are not limiting the time, you are willing to invest into it.
- **Time frame:** 1 week
- **Technologies:** Technologies of your choice
- **Data:** Data source sample of your choice
- **Things to take into consideration and discussion:**
 - One of our input database is OpenStreetMap
 - The server is now using TypeScript
 - Data are being pre-processed by Java
 - Data sources
